

# MHF4UO FINAL EXAM REVIEW #2 – EQUATIONS AND GRAPHS

1. The following is a list of types of equations that we have encountered in this course.
  - (a) Classify each equation as an *identity*, an *equation to be solved* for the unknown, an *equation of a function* or an *equation of a relation*.
  - (b) Give a geometric (graphical) representation of each equation.
  - (c) For the equations that are identities, prove that the expression on the L.S. is *equivalent* to that on the R.S.
  - (d) For the equations of functions/relations, use the equation to find a point that lies on the graph of the function/relation. (Mark that point on the graph.)
  - (e) Solve the equations that are neither identities nor equations of functions/relations.

| Equation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Type of Equation      | Geometric(Graphical) Representation                                                                                                                         | Proof/Solution/Evaluation to find Point on Graph                                                                                                                                                                                                      |

2.

Match each equation with the most suitable graph. Explain your reasoning.

a)  $f(x) = 2(x + 1)^2(x - 3)$

c)  $f(x) = -2(x + 1)(x - 3)^2$

b)  $f(x) = 2(x + 1)^2(x - 3)^2$

d)  $f(x) = x(x + 1)(x - 3)(x - 5)$

A

C

B

D

a, c  $\rightarrow$  degree 3  $\rightarrow$  only possible graphs are B, C  
 because of opposite end behaviours  
 $\rightarrow$  zeros of B and C are the same,  
 which does not help make a choice  
 $\rightarrow$  (c) must match B because when  
 expanded, the coefficient of  $x^3$  would  
 be negative

b, d  $\rightarrow$  degree 4  $\rightarrow$  only possible graphs are A and D  
 (same end behaviours)  
 $\rightarrow$  (b) must match D because the zeros match
