11. The Spider and the Fly Problem is a classic puzzle that originally appeared in an English newspaper in 1903. It was posed by H.E. Dudeney. In a rectangular room with dimensions 30 ft by 12 ft by 12 ft, a spider is located in the middle of one 12 ft by 12 ft wall, 1 ft away from the ceiling. A fly is in the middle of the *opposite* wall 1 ft away from the floor. If the fly does not move, what is the shortest distance that the spider can crawl along the walls, ceiling, and floor to capture the fly?

Hint: Using a net of the room will help you get the answer, which is less than 42 ft!

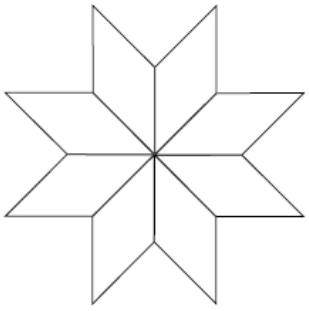
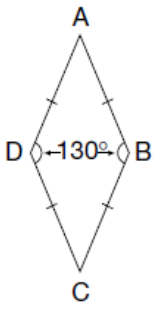
Eight-Pointed Star



Quilt Piece



Is it possible to make the quilt using pieces like the given piece? Explain.

Answers

1. $x=60°$, $y=133°$

2. $a+b+c+d+e=180°$

3. $x=93°$, $y=111°$

4. Since eight pieces are needed to make the quilt, $\angle DAB$ and $\angle DCB$ should both have a measure of $\frac{360°}{8}=45°$. Using the fact that the sum of the interior angles of a quadrilateral is 360°, it follows that $\angle DAB$ and $\angle DCB$ actually both have a measure of $\frac{360°-2(130°)}{2}=50°$. Therefore, it is ***not possible*** to make the quilt using the given pieces.
