13. Write **fully simplified** expressions for the **perimeter** and **area** of the shape shown at the right. (10 APP)

Perimeter

$$\begin{aligned}
 P &= 9a+3 + 4b + a-1 + 2b+9 \\
 &\quad + 5a+5 + 2b+9 + 3a-1 \\
 &\quad + 4b \\
 &= 9a+a+5a+3a \\
 &\quad + 4b+2b+2b+4b \\
 &\quad + 3-1+9+5+9-1 \\
 &= 18a+12b+24 \text{ units}
 \end{aligned}$$

Area

$$\begin{aligned}
 A &= \text{area rectangle } ABCD - \text{area rectangle } EFGH \\
 &= 4b(9a+3) - (5a+5)(2b+9) \\
 &= 36ab+12b \\
 &\quad - (10ab+45a+10b+45) \\
 &= 36ab+12b + (-10ab-45a-10b-45) \\
 &= 36ab+12b-10ab-45a-10b-45 \\
 &= 36ab-10ab-45a+12b-10b-45 \\
 &= 26ab-45a+2b-45
 \end{aligned}$$

14. Write a **fully simplified** algebraic expression for the **volume** of the triangular prism shown at the right. (6 APP)

Hints: (i) You need to use the Pythagorean Theorem. (ii) $V = (A_{\text{base}})h$

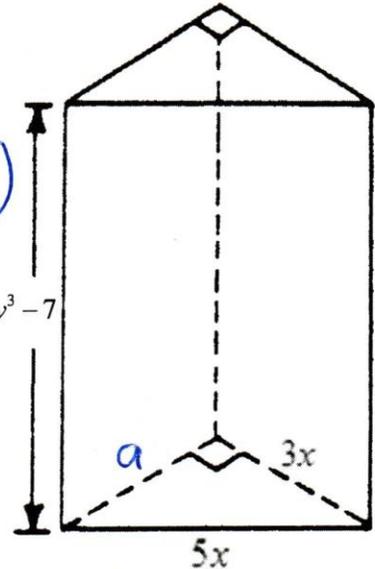

By the Pythagorean Theorem,

$$\begin{aligned}
 a^2 + (3x)^2 &= (5x)^2 \\
 \therefore a^2 + 9x^2 &= 25x^2 \\
 \therefore a^2 &= 25x^2 - 9x^2 \\
 \therefore a^2 &= 16x^2 \\
 \therefore a &= \sqrt{16x^2} = 4x
 \end{aligned}$$

$$\begin{aligned}
 V &= (A_{\text{base}})(h) \\
 &= \frac{3x(4x)}{2} (2y^3-7) \\
 &= \frac{12x^2}{2} (2y^3-7)
 \end{aligned}$$

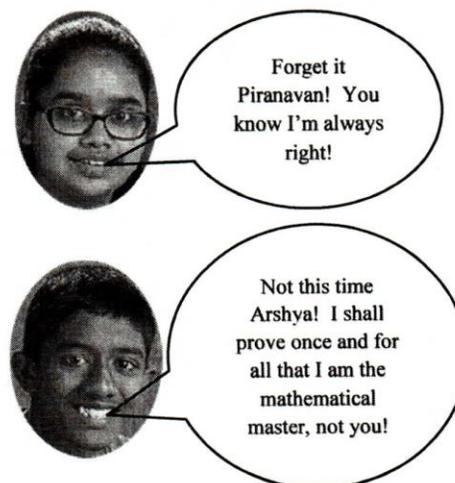

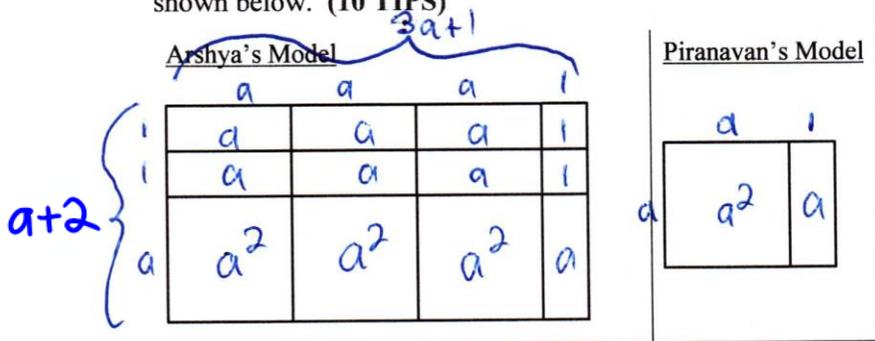

$$\begin{aligned}
 &= 6x^2(2y^3-7) \\
 &= 12x^2y^3 - 42x^2
 \end{aligned}$$

The volume of the triangular prism is $12x^2y^3 - 42x^2$ units³.

15. Arshya and Piranavan are arguing over a math problem. Each creates a geometric model to attempt to demonstrate how to expand the product of binomials $(3a+1)(a+2)$. Their geometric models are shown below. (10 TIPS)

The Dimensions of the Shapes they used in their Models

Which model correctly demonstrates how $(3a+1)(a+2)$ should be expanded? **Justify** your answer. (In other words, **explain in detail why** the model that you have chosen is correct.)

Arshya's model is correct!

$A_{\text{Arshya's Model}} = lw = (3a+1)(a+2)$ ✓

But,

$A_{\text{Arshya's Model}} = a^2 + a^2 + a^2 + a + a + a + a + a + a + 1 + 1$ ✓
 $= 3a^2 + 7a + 2$ ✓

Applying the distributive property gives the same result:

$(3a+1)(a+2) = 3a^2 + 6a + a + 2$ ✓
 $= 3a^2 + 7a + 2$ ✓

$A_{\text{Piranavan's Model}} = lw = a(a+1)$ ✓
 $= a^2 + a$ ✓

This is obviously incorrect.

$\therefore (3a+1)(a+2) = 3a^2 + 7a + 2$

Bonus Question: You are not required to attempt this question. Extra credit will be given for good responses.

Simplify the algebraic expression given below. In your answer, arrange the variables in alphabetical order.

sooriyakumaran = $aaaikmnoorsuy = a^3ikmno^2rsuy$
 $+2$ if in alphabetical order
 $+1$ if not
