

# MPM1D9 COURSE SUMMARY AND TIMELINE

## Understanding Mathematics

Focus on **MEANING** instead of appearance.

e.g.  $3+x$  and  $3(+x)$  look a lot alike but have very different meanings.

## Summary of Units 0 to 3

Unit Number and Name	Main Ideas/Principles
Unit 0- Introduction to Mathematical Thinking	<ul style="list-style-type: none"> <li>• Simple Model of Mathematics: Objects, Operations and Relationships</li> <li>• Measurement and Geometry Relationships</li> <li>• A knowledge of formulas is <i>not enough</i> and in itself <i>does not</i> constitute mathematical thinking! Formulas are merely the <i>finished products</i> of mathematical thinking.</li> <li>• True mathematical thinkers seek to <i>discover</i> and <i>understand</i> how quantities are <i>related</i> to one another.</li> <li>• Mathematical shortcuts and “tricks” should not be used by those who have not yet achieved a deep understanding of the concepts being learned. Once the concepts are mastered, shortcuts can be used but always with caution. <u><i>Shortcuts that compromise understanding should never be used!</i></u></li> </ul>
Unit 1- Number Sense and Algebra	<ul style="list-style-type: none"> <li>• Algebra is nothing more than arithmetic with unknowns.</li> <li>• As such, algebra can be <i>understood</i> quite easily if one has a thorough grasp of basic mathematical operations (+, −, ×, ÷, powers, etc.) and the order in which they should be applied (“BEDMAS”).</li> <li>• <math>+ / -</math> → “gain” / “loss”, like terms (“2 apples + 5 apples = 7 apples”)</li> <li>• <math>\times / \div</math> → “groups of” / “how many groups of”, expanded form, exponent laws</li> <li>• <math>+ / \times</math> → commutative and associative (order doesn’t matter, nor do brackets)</li> <li>• <math>- / \div</math> → <i>not</i> commutative or associative (order and brackets <i>do</i> matter)</li> <li>• The distributive property</li> </ul>
Unit 2- Solving Equations	<ul style="list-style-type: none"> <li>• To maintain equality, whatever operation is performed to one side of an equation <i>must</i> also be performed to the other side.</li> <li>• By choosing an appropriate set of operations that is applied to both sides, all linear equations can be reduced to the form <math>ax+b=c</math>, where <math>x</math> is the unknown and <math>a</math>, <math>b</math> and <math>c</math> are constants.</li> <li>• Once a linear equation is reduced to the form <math>ax+b=c</math>, the solution can be found by <i>undoing</i> the operations in the order <i>opposite</i> of BEDMAS.</li> <li>• Many problems can be modelled using linear equations. In such cases, it is simply a matter of translating the statement of the problem into an equation, which is then solved using the techniques described in unit 2.</li> <li>• These same techniques can also be used to rearrange formulas, that is, to solve for one variable in terms of all the others.</li> </ul>

<i>Unit Number and Name</i>	<i>Main Ideas/Principles</i>
Unit 3- Analytic Geometry	<ul style="list-style-type: none"> <li>Analytic Geometry bridges the gap between algebra and geometry.</li> <li>Relations can be described using <u>words</u>, <u>tables</u>, <u>equations</u> and <u>graphs</u>.</li> <li>Unit 3 focuses on <b>linear relations</b>, the simplest of all mathematical relationships. Linear relations are divided into two classes: <ul style="list-style-type: none"> <li><b>Direct Variation</b> e.g. Sakshi earns \$15 per hour</li> <li><b>Partial Variation</b> e.g. Michelle earns a base salary of \$25000 plus 5% of sales.</li> </ul> </li> <li>Linear relations are completely characterized by the equation <math>y = mx + b</math>, where <math>x</math> is the independent variable, <math>y</math> is the dependent variable, <math>m</math> is the slope and <math>b</math> is the y-intercept.</li> <li>Linear relations have a constant rate of change. That is, the dependent variable changes at a rate that is constant with respect to the independent variable. Another way of putting this is as follows: if <math>\Delta x</math> is constant, then <math>\Delta y</math> is also constant (i.e. the <b>first differences</b> are constant).</li> <li>Relations that are not linear are called <b>nonlinear</b>. Nonlinear relations have a variable slope (rate of change). If the equation of a nonlinear relation is known, then calculus can be used to determine the slope (rate of change) at any point.</li> <li><math>m</math> = slope = constant of variation = rate of change of <math>y</math> with respect to <math>x</math></li> <li><math>b</math> = y-intercept = vertical intercept = initial value</li> </ul>

### *The Rest of the Course*

<i>Unit</i>	<i>Important Points</i>	<i>Completion Date</i>
Unit 3- Analytic Geometry	<ul style="list-style-type: none"> <li>Most of this unit has already been completed.</li> <li>Pages 26-28 are optional BUT it is a good review of measurement relationships as seen from the point of view of analytic geometry.</li> <li>Do review problems: pp. 29-34</li> <li>Extra Review: Unit 3 menu on <a href="http://www.misternolfi.com">www.misternolfi.com</a></li> <li>Unit 3 practice test on <a href="http://www.misternolfi.com">www.misternolfi.com</a></li> </ul>	Thursday, May 7, 2015
Unit 4-Linear Relations	<ul style="list-style-type: none"> <li>This unit builds upon unit 3 but the focus changes to an in-depth study of the properties of linear relations.</li> <li>Carefully study the explanations and examples given in unit 4.</li> <li>Complete all activities and homework</li> <li>Also complete the following found in the unit 4 menu: <ul style="list-style-type: none"> <li>Interpreting Graphical Information</li> <li>Parallel/Perpendicular Problems</li> <li>Extra Review</li> <li>Practice Test</li> </ul> </li> </ul>	Wednesday, May 19, 2015

Check back in a few days for updates.
